

# Command Line

## How do I log the connection IP in qmail (H-Sphere)?

In versions newer than H-Sphere 2.5 Patch 1 you can increase the logging level by editing the `"/var/qmail/control/options"` file. Simply add (or edit any existing setting) to have `"smtplog=2"` on it's own line.

With this added restart qmail `"/etc/init.d/qmaild restart"` new connections will now be logged will be more verbose - into `"/var/log/maillog"` this will also include the IP address used to initiate the connection to qmail.
