Command Line

How do I install the same RPM packages on a new server as an old?

First you need a list of the packages on the old server.

```
rpm -qa --qf "%{NAME}\n" > rpmlist.txt
```

Copy this file to the new server (for example using SSH).

To bulk install all of the packages installed on the old server

```
yum install `cat rpmlist.txt|tr '\n' ' '`
```

You should then be prompted to install all packages missing on the new server.
