

Internet

How do I find all sites hosted on the same IP address?

To find all sites hosted on the same IP address is not an easy task due to the way a server can be configured to answer for any domain name even those that do not exist or doesn't point to the IP in question.

We advise using our [DNSHistory](#) tool to find possible sites hosted on the same IP address.

1. Open up [DNSHistory](#) in a new window.
2. Type in the domain name in question into the search box.
3. If the search returns a CNAME then click on this until you get to an entry with an "A" record.
4. If multiple A records are shown you will need to repeat the instructions below for each IP address listed.
5. Click on the IP address shown under the A record heading.
6. Next to the heading "What links here by" click on "A".
7. You should now be shown a list of all other domain names that are potentially hosted on this IP address.

The list of domains shown is most likely not complete but should give you a good idea of other sites hosted on the IP.
