

Hosting Control Panels

How do I log the connection IP in qmail (H-Sphere)?

In versions newer than H-Sphere 2.5 Patch 1 you can increase the logging level by editing the `/var/qmail/control/options` file. Simply add (or edit any existing setting) to have `smtplog=2` on it's own line.

With this added restart qmail `/etc/init.d/qmaild restart` new connections will now be logged will be more verbose - into `/var/log/maillog` this will also include the IP address used to initiate the connection to qmail.
