

Command Line

After upgrading Cacti all image/css/etc links are pointing to / rather than /cacti/

After upgrading Cacti from RPMForge cacti images/etc are linked to / rather than the /cacti/ directory.

To resolve this you will need to edit the "/var/www/cacti/include/config.php" file with your chosen text editor and add in the following config option.

```
$url_path = "/cacti/";
```

After this has been saved you will be able to visit your Cacti installation and the links will function correctly.
